Symptom	First Theory	Checks Performed	Actual Cause	Fix
Alice had Sales on both F: and S: drives	Incorrect drive mapping	Comparing GPO settings with This PC	Old F: mapping remained after changing the policy	Force removed F: drive from Alice's PC through CMD
Alice sees "Your account has been deactivated. Please see your system administrator"	User account is deactivated	Check AD Users and Computers to see if Alice's account is activated	Account was deactivated	Enable Alice's account and confirmed sign in now works
DNS lookups timed out because Client01 was pointed to an unused DNS address	Client01 was manually configured to point at an unused DNS address	'nslookup dc01.lab.test' returned 10.77.77.254 and timed out On client01, checked 'Applications and Service Logs → Microsoft → Windows → Dhcp-Client → Admin'. Found event 1001, source Dhcp-Client, on 13/10/2026 at 13:17:33. Message reported that the computer was not assigned an IP address by DHCP.	Client01s ethernet properties defined the DNS address as 10.77.77.254, an unused DNS address within lab.test	Reactivated automatic DNS from DHCP
Alice could no longer access the Sales folder	Alice lost permissions	Whether Alice was still in the Sales Group	Alice was no longer in GG_Sales	Restored Alice's membership into GG_Sales, signed out and signed back in and confirmed access
client01's secure channel returned False after restarting from Server	Connection was interrupted	Signed in locally to client01 and ran in powershell 'Test-ComputerSecureChannel -Verbose' which returned False On client01,	Resetting the AD computers account broke its trust with client01	Repaired with 'Test-ComputerSecureChannel -Repair' and then verified the connection was True and confirmed Alice could sign in again

		checked event viewer → windows logs → system. Found the NETLOGON event 3210 at 9:59:48 on 15/10/2026. The event reported that client01 could not authenticate with dc01.lab.test.
